

## Lab # 5 (CSS Part II)

1. Create an external CSS that has a class selector with two declarations (the first declaration for changing the text color and the second declaration for changing the text's background color). This formatting should apply for **both headings and paragraphs**. **NOTE: create this formatting in ONE CSS RULE.**
2. Create a pseudo-class selector to change the color of a link to red when the mouse passes over it.
3. Create a pseudo-element selector to change the first letter of the paragraph to green and size to x-large.
4. Set the background of the whole page to an image that sticks to the browser window
5. Create an image element selector with these declarations in one CSS rule
  - Set a dotted border with 5px width with any color of your choice
  - Add an extra space around the image, but inside the outer edge (border)
  - Put a background color to your image. (Not the color you've chosen for your border).
  - Adjust the space between the image and the element above.
  - Change the cursor when it comes over the image to a pointer.
  - Make the text wrap around the image: let the image be on the left and the rest flow to its right.
6. Create an ordered list of four items and change the markers to upper-alpha.
